

Diversity of Australian Subterranean Fauna

Yvonne Ingeme
Victorian Speleological Association, Inc

Pictorial display of a selection of Australian Stygofauna and Troglofauna aimed at raising awareness of the biodiversity of subterranean fauna that exists within Australia.

Diversity of Australian Subterranean Fauna

Yvonne Ingeme, Hamilton, Victoria (VSA)

Troglofauna

Troglofauna are generally characterised by loss of eyes and body pigment and occur in air chambers in underground caves or small voids.

Atelurinae

Blattidae

Curculionidae sp

Pselaphinae

Stygiochiropus communis

Speleostrophus nesiotes

Trinemura trogliphila

Phaoneura proserpin

Ngamarlanguia luisae

Nocticola flabellata

Juliformia

Polyxenida

Draculoides sp.

Tyrannochthonius sp.

Hyella sp.

Bamazomus vespertinus

Glennhunitia

Bengalla bertmaini

Stygofauna

Stygofauna are aquatic animals and live in a variety of groundwater systems including limestone, alluvial and fractured rock aquifers from a variety of geological histories.

Nedsia sculptilis.

Melitidae amphipod

Halosbaena tulki

Haptolana pholeta

Lasionectes exleyi

Dytiscidae-Limbodessus sp.

Calanoid copepod

Pygolabis sp.

Stygiocaris stylifera

Bogidiella sp.

Bathynellacean

Pilbaraphretopterus platyarthricus

Thanks to Jane McRae for the use of her photos and Bill Humphreys for the use of the WA Museum photo collection.

LEGEND Invertebrate types are indicated by the box colour corresponding to the text colour below:
Diplopoda (millipedes), **Gastropoda** (mollusc), **Arachnida** (spiders, pseudo scorpions),
Crustacea (shrimps, slaters), **Oligochaeta** (worms), **Insecta** (beetles, crickets, cockroaches),
Sympyla (centipedes). **Vertebrate type** (Fish)
